Definition (Partitionifolds)

Let M be a smooth manifold. A partitionifold of M is a partition of immersed connected submanifolds which we call **leaves**.

Definition (Smooth singular foliation)

A **smooth singular foliation** $\mathscr{F}$ on a smooth manifold M is a subspace of $\mathfrak{X}_c(M)$ so that

- it is **involutive**,
- it is **stable under** $C^\infty(M)$**-multiplication**,
- it is **locally finitely generated**.

Theorem ($\mathscr{F}$-connections)

There is a connection on the normal bundle of a leaf L:

- *Horizontal vector fields are in* $\mathscr{F}$.
- *Parallel transport* PT_γ *has values in* $\mathrm{Sym}(\tau_l, \tau_{l'})$.
- *For a contractible loop* γ_0 *at* l*:* PT_{γ_0} *values in* $\mathrm{Inner}(\tau_l)$.

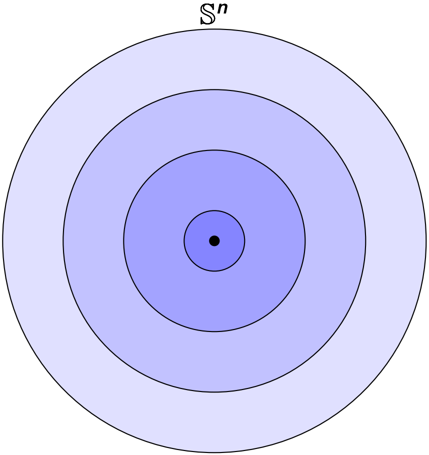
Example of a transverse foliation τ:



Remarks

- Inner(τ_I) maps each circle to itself
- Sym(τ_I) allows to exchange circles
- Both preserve τ_I and fix the origin

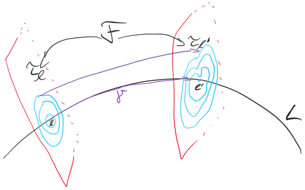
Recovering the ordinary definition

Foliation	Connection
Regular	Flat lift
Singular	Family of possibly curved lifts



Remarks ($\mathscr{F}$-connection)

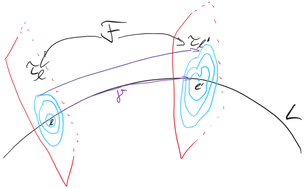
For $\phi \in \mathrm{Sym}(\tau_l)$ we have an induced parallel transport

$$\mathrm{PT}_\gamma^{\mathrm{Sym}}(\phi) := \mathrm{PT}_\gamma \circ \phi \circ \mathrm{PT}_\gamma^{-1}.$$

Then, on the normal bundle $\pi\colon \mathscr{T} \to L$,

$$\mathrm{PT}_\gamma(\phi \cdot p) = \mathrm{PT}_\gamma^{\mathrm{Sym}}(\phi) \cdot \mathrm{PT}_\gamma(p)$$
$$\mathrm{PT}_{\gamma_0}(p) = \varphi \cdot p$$

for all $p \in \mathscr{T}_l$, $\phi \in \mathrm{Sym}(\tau_l)$, and for some $\varphi \in \mathrm{Inner}(\tau_l)$.



Remarks (Sym-connection)

For $\phi \in \mathrm{Sym}(\tau_l)$ we have an induced parallel transport

$$\mathrm{PT}^{\mathrm{Sym}}_{\gamma}(\phi) := \mathrm{PT}_{\gamma} \circ \phi \circ \mathrm{PT}^{-1}_{\gamma}.$$

Then

$$\mathrm{PT}^{\mathrm{Sym}}_{\gamma}(\phi \circ \phi') = \mathrm{PT}^{\mathrm{Sym}}_{\gamma}(\phi) \circ \mathrm{PT}^{\mathrm{Sym}}_{\gamma}(\phi')$$
$$\mathrm{PT}^{\mathrm{Sym}}_{\gamma_0}(\phi) = \varphi \circ \phi \circ \varphi^{-1}$$

for all $\phi, \phi' \in \mathrm{Sym}(\tau_l)$, and for some $\varphi \in \mathrm{Inner}(\tau_l)$.

Generators of $\mathscr{F}$ given by:

$$\mathbb{H}(X) + \overline{\nu},$$

where $X \in \mathfrak{X}(L)$, $\mathbb{H}(X)$ its projectable horizontal lift, $\nu \in \Gamma(\mathrm{inner}(\tau))$ and $\overline{\nu}$ its fundamental vector field.

We need:

1. Lie algebra bundle τ with structure τ_I
2. A horizontal lift $\mathbb{H}$ into $\mathscr{T}$ satisfying

$$
\begin{aligned}
\text{Curvature:} \qquad & [\mathbb{H}(X), \mathbb{H}(X')] - \mathbb{H}([X, X']) \in \tau \\

- preserve group bundle action,

Remarks (Why a "curved theory"?)

Usually, the field strength F is given by (abelian, for simplicity)

$$F := \mathrm{d}A = \mathrm{d}^{\nabla^0} A.$$

$\rightsquigarrow$ We will use a general connection ∇ instead of ∇^0, and ∇ may not be flat.

Going back to foliations

Theorem ([C. L.-G., S.-R. F.])

Given a multiplicative Yang-Mills connection on $\mathscr{G}$ and a Yang-Mills connection $\mathbb{H}$ on $\mathscr{T}$, then there is a natural foliation on $\mathscr{T}$ generated by

$$\mathbb{H}(X) + \overline{\nu},$$

where $X \in \mathfrak{X}(L)$ and $\nu \in \Gamma(\mathscr{g})$.

Proof.

We have

$$[\mathbb{H}(X), \overline{\nu}] = \overline{\nabla_X \nu},$$
$$[\mathbb{H}(X), \mathbb{H}(X')] = \mathbb{H}([X, X']) + \overline{\zeta(X, X')},$$

where $\zeta \in \Omega^2(L; \mathscr{g})$.
